APRIL 18, 1854

IMPORTANT INFORMATION:

YOUR DRINKING WATER SERVICE LINE LEAD STATUS IS UNKNOWN

The Village of Youngstown has not yet identified what your service line is made of. All or a part of your service line may be made of lead.

What is a Lead Status Unknown Service Line?

A service line is the pipe connecting the water main to the building inlet. A typical configuration of a service line is shown here. The Village owns from water main to the curb stop and home owner owns from curb stop to the house. material is unknown, we need to categorize it as a lead status unknown service line.

Example of a Service Line. If any section of the service line is made of lead, the service line is classified as a lead service line.

What Does It Mean?

Having a lead service line doesn't necessarily mean your drinking water contains an elevated level of lead. However, a lead service line has been identified as a source of lead and may contribute to lead in drinking water. This can happen when the characteristics of water (for example, low pH) increase the corrosion of lead pipes. Removing the lead service line is a sure way to reduce your chance of exposure to lead in drinking water.

Source of Lead in Drinking Water

Lead enters drinking water from a lead service line and indoor plumbing materials such as lead solder on copper pipes and chrome-plated brass or brass fixtures and faucets.

Health Effects of Lead

Exposure to lead in drinking water can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney or nervous system problems.
